MonSoteria Cloud Security Practice

Helping you get a handle on security in the cloud

Moving to the cloud may only be the first step in your cybersecurity journey.

It may be a dangerous assumption to believe that the cloud environment will be a panacea to all your cybersecurity challenges

To rely on mere technical protections provided by cloud vendors to protect your Crown Jewels may not be a good idea.

You have to take charge of the security of your vital assets in the cloud. We can show you how.

Just by moving to the cloud does not take away the need to set up a SOC and actively monitor your Crown Jewels, nor does it take away the need to isolate and simplify processes around your Crown Jewels.

The cloud model operates at various levels and understanding exactly how the responsibility for cybersecurity is divvied up is vital. Do not make the fatal mistake of assuming that "everything is taken care of" just because you moved to the cloud.

MonSoteria's cloud practice helps you design your cybersecurity architecture as you move some or all of your assets to the cloud.
