MonSoteria SEC Security Practice

Securing unstructured information is vital for cybersecurity

Relying solely on security provided by the file system or e-mail system can prove fatal.

Most of the information an organization has is unstructured and security around it is generally weak

"**Thanks to MonSoteria we now have robust security around our SEC filings.**"

- General Counsel Public Company

In August 2015 US authorities broke up an insider-trading ring that relied on computer hacker to steal corporate press announcements on earnings before they became public.

Organizations typically rely on the security of the file system and the e-mail system to keep unstructured information secure. This information may relate to SEC filing or it may be other confidential information related to an acquisition or divesture or other vital corporate secrets. Many times the secret unstructured information is scattered all over the organization and if it is being e-mailed around then it may be even be leaving the organizations perimeters and control.

In general the security of unstructured information is an after thought and is quite weak. To help ramp up the security around this information MonSoteria has set up a specialized practice that can leverage best practices and tools that can provide you with cost effective and quick results.
