

MonSoteria SOC Service

Active Monitoring is vital for your cybersecurity

The cost of a successful breach is directly proportion to the time it takes to detect it.

99% of major breaches were not detected by organizations being hacked!

“We made a quantum jump in our SOC capabilities thanks to MonSoteria!”

- CIO, Major Corporation

The reason why monitoring as it is currently practiced gives so poor results is that it sets up a monitoring system without fully understanding the underlying business processes that are being monitored.

Trying to make monitoring successful only on the basis of technical tools sets you up for failure. Instead there has to be a conscious effort to set up monitoring parameters tied to the logic of the underlying processes.

Understanding Active Monitoring

A key idea in the field of monitoring is the concept of “Active Monitoring”. This refers to the notion of focusing monitoring effort on “Crown Jewels” and doing it in a manner that allows it to be done without too many false positives.

This is accomplished by simplifying processes around the crown jewels so that anomalies can be detected while false positives are kept to a minimum. Another key aspect is that Crown Jewels are isolated so that white lists can be imposed on access and processes that happen there.

MonSoteria SOC practice can help you set up your SOC or augment it. We can help assure you of better results from your SOC investment dollars by making sure that your Crown Jewels are Actively Monitored.
