

# MonSoteria Security Infrastructure Service

Design and implement a secured network infrastructure

Taking a given network and redesigning it for better security.

## The difficulty of defending a network is directly proportional to its complexity

- Law 8, Ten Immutable of Security Administration

**“We now have a network that is both easy to manage and secure thanks to MonSoteria!”**

- Director of IT of Public Company

It is true that it is easy to design security upfront, than to bolt it on later. It is also true that security becomes both difficult and expensive in a poorly architected network.

This is why network design and architecture is a key element in effective cybersecurity. And this is why we have created a specialized practice that allows organizations to transition from their existing network architecture to a design that is both secure and simple. Rather than trying to bolt on security to an existing network design, this practice helps architect and reengineer the network to ground up support better security.

The roadmap is a key element of reengineering networks. The roadmap we provide shows the best path to

get to a network that is architected for simplicity and security. It does this by ensuring that the path forward is both cost-effective and it leads to improved security every step of the way. But network architecture does not operate in a vacuum. It has to be intimately aware of the key assets and Crown Jewels it is defending, and it is on this basis that the system is designed.

Call us now and get started on your journey that takes you to improved security while lowering your total cost of ownership.
