

MonSoteria Training Practice

Ignore human vulnerabilities at your own peril!

Human vulnerability exploits are a major factor in most cybersecurity breaches.

Human vulnerabilities can defeat even the most well designed cybersecurity

“MonSoteria helped us ramp up our cybersecurity training in a measurable way!”

- CIO, Major Infrastructure facility

Cybersecurity is not just about technology; humans are also a vital component.

The challenge with cybersecurity training is to make sure it is effective by measuring progress and remediating deficiencies. This is why actual classroom or computer-based training is only one leg of an effective training program. The other legs are: assessment and remediation. This means that what happens after the class is completed is as important as the training itself.

MonSoteria provides a robust program that keeps track of every trainee and his or her assessment results. Assessments can be done immediately after the class or at periodic intervals, and assessments can be done as normal question-answer tests or they can be done in terms of actual phishing or social

engineering mocks or some combination. Trainees that do not make the grade in the assessment are then required to do remediation training till the required level of proficiency is achieved.

Training types

General training can be provided to business users. More focused training can be provided to those accessing Crown Jewels, including business users, IT staff and IT admin. MonSoteria can design a training practice customized to your needs.
